AI Readiness Checklist

20 things to confirm before you adopt AI

No technical knowledge required. Check ✓ the items that apply, and you will see where your company stands and what to do next. Feel free to use this sheet as it is in your next internal meeting.

1 Tools & safety — The foundation

✓ ____ / 4

- [ ] **Your company has a corporate subscription to generative AI such as ChatGPT**
  If everyone uses personal accounts, know-how walks out the door with each departure
- [ ] **You have shared a rule on "what must never be entered into AI"**
  Customer data, unreleased figures. A one-page memo is enough
- [ ] **You chose your plan knowing the difference between free and paid tiers**
  For business use, confirming that your data is not used for training comes first
- [ ] **There is a rule that a human reviews AI output before it is used**
  AI makes mistakes. "A human checks last" is the precondition for adoption

2 Daily use — Is it actually used?

✓ ____ / 4

- [ ] **More than one person used AI for work in the past week**
- [ ] **There is at least one concrete example of "AI made this task easier" in your company**
- [ ] **The methods of your best users are shared with everyone else**
  Even a simple shared memo of prompts (instructions to AI) changes a lot
- [ ] **You know why non-users don't use it (anxiety, no time, no perceived need)**

3 Workflows — Where AI pays off

✓ ____ / 4

- [ ] **You have listed the "similar documents written again and again": emails, reports, quotes**
- [ ] **You can say where copy-paste work between systems and Excel happens**
- [ ] **Frequently asked questions are not handled by one overloaded person**
- [ ] **You don't lose time searching through paper and PDF documents**
  "Time spent searching" is often a data-storage problem before it is an AI problem

4 Champions People who keep it going ✓ ____ / 4

- [ ] There is a go-to person for AI questions in your company
- [ ] That person is not drowning in their day job on top of the AI role
- [ ] You have someone outside the company you can casually ask (a partner or vendor)
- [ ] Trying new ways of working is welcomed, not blamed

5 Leadership Does it last as an investment? ✓ ____ / 4

- [ ] AI adoption has been discussed at management level
- [ ] There is a rough budget for AI, however small
- [ ] You have an idea of what to do with the hours AI frees up
  Deciding how to reinvest saved time makes the payback much faster
- [ ] You plan to start in small units that can be stopped if they don't work

Total ✓ _____ / 20

How to read your score Count your ✓s

16–20	**Self-sufficient**	Solid foundation. Next: expand to high-impact tasks and make it routine.
10–15	**Partial adoption**	Some teams use AI well. Next: build usage patterns per department.
5–9	**Tools first**	Tools are in place but not in daily use. Embedded support helps most here.
0–4	**Before the start**	Starting now is fine. Begin by choosing your very first task.

Your next move In this order

1 Pick one task only
From the unchecked items, pick one task that occurs daily or weekly. Company-wide rollouts almost always fail.

2 Test on real data
Use your actual emails and documents, not made-up samples. What matters is whether it works on your real work.

3 Measure, then expand
Measure hours saved per month before moving on. With numbers, you won't need to persuade anyone.

> **Hint** If you scored 5–9, you have the tools but people are not using them. The cause is neither the tool nor your staff: nobody has fitted AI to your actual workflows yet. An engineer working inside your operation is the shortest path.

We decide where to start, together

In a free consultation, we go through the items you left unchecked and choose the first task to work on in your business.
